A3 – Inspecting a Network Request

The homepage was inspected using Chrome Developer Tools. The main document request used the GET method and returned a 200 OK status code. The response Content-Type was `text/html; charset=utf-8`, indicating that the server returned an HTML document.

Method = GET

Status = 200

Content-Type : text/html

Requests : 115 requests | 9.4 MB transferred | 3.1 MB resources

Transfered / Size : 15.9 kB

Fetch/XHR : 117 request

A4 – Missing Page (404 Error Handling)

A non-existing URL was entered to test how the website handles missing pages. The website displayed an error page indicating that the requested page could not be found.

- **Test URL:** https://www.lefkosabelediyesi.org/KKK
- **HTTP Status Code:** 404 NOT FOUND
- **Error Message:** Unfortunately, we could not find the page you are looking for.

Evaluation: The website displays an error page when users try to access a non-existing page. This helps users understand that the requested content is unavailable.

A5 – Caching

The Cache-Control header of the main document was checked using Chrome DevTools. The header value was "No cache private"

.

An image or JavaScript file was also inspected. Its Cache-Control header was "cache-control : max-age =1440".

These headers indicate how the browser should store and reuse website resources. This can help improve loading speed when visitors return to the website.

A6 – HTML Structure and SEO

- **Title:** <title>Lefkoşa Türk Belediyesi</title>
- **Meta Description: X**
- **H1 Heading:** X
- **H2 Headings:** <h2 class="h2 pb-2">Online İşlemler</h2>
- **Image Alt Attributes:** Have

Evaluation: The HTML structure was examined to assess the website's basic SEO and accessibility features.

A7 – JavaScript Errors

- **JavaScript Errors:** www.lefkosabelediyesi.org/:1160
  GET
  https://static.cloudflareinsights.com/beacon.min.js/vce701823e78c4301a35b7e07294d87301792088814092 net::ERR_BLOCKED_BY_CLIENT

- **Warnings:** X

Evaluation: The browser console was checked to identify JavaScript errors that may affect the website's functionality.

B1 – Loading State

The website was tested using the Slow 3G network setting in Chrome DevTools. During loading, a white screen appears.

B2 – Empty Search Results

The website was tested by searching for the keyword "zzzqqq", which is unlikely to match any existing content. The website displayed the message **"Maalesef bulamadık"** (Unfortunately, we couldn't find it).

Evaluation: The website clearly informs visitors when no search results are available. However, the message does not provide an additional suggestion or next step to help users continue their search.

B3 – Offline Experience

After reloading the page, Chrome displayed its standard network error message instead of a website-specific offline notification.

Evaluation: The website does not appear to provide a custom offline experience or a retry option. This may make it harder for visitors to understand how to continue when their internet connection is unavailable.

B4 – Form Validation

The form was tested by leaving a required field empty and clicking the submit button. The entered information was preserved, and the empty field was highlighted in red. However, no clear error message was displayed; only a blocking symbol appeared.

Evaluation: The website prevents incomplete form submission and preserves the entered information. However, the lack of a clear error message may make it difficult for users to understand what they need to correct.

B5 – Form Labels

The contact form contains six fields: First Name, Last Name, Phone, Email, Question, and Feedback. Clicking on the field labels does not move the cursor to the corresponding input fields.

Evaluation: The labels do not appear to be properly associated with their input fields. This may reduce usability and make the form less accessible for some users.

B6 – Keyboard Navigation

The website was tested using only the keyboard. The Tab key successfully moves the focus between interactive elements in a logical order. A visible focus outline is displayed around the selected elements, and no keyboard navigation traps were observed.

Evaluation: The website provides a good basic keyboard navigation experience, allowing users to navigate interactive elements without using a mouse.

B7 – Automated Accessibility Audit

Google Chrome Lighthouse was used to perform automated accessibility tests on the website.

Page	Accessibility Score
Home Page	93/100
Inner Page	93/100

Evaluation: Both pages received an accessibility score of 93/100. No failed accessibility audits were reported. However, Lighthouse identified the use of a meta refresh element under Best Practices. Additional manual accessibility checks are recommended because automated tools cannot evaluate every aspect of accessibility.

B8 – Link and Button Text

Several links and buttons were reviewed on the website. Some examples include "Show More Details", "For All News", an accessibility options button represented by a human icon, and Instagram and Facebook icons.

Current Text / Button	Suggested Improvement
Show More Details	View News Details
For All News	View All News
Human icon	Accessibility and Language Settings
Instagram icon	Visit Our Instagram Page
Facebook icon	Visit Our Facebook Page

Evaluation: Some buttons and links could use more descriptive text to make their purpose clearer. Social media and accessibility icons should also have accessible names for screen reader users.

Part C – Recommendations

C1 – Website Strengths

1. Good Keyboard Navigation

The website supports keyboard navigation. Users can move between interactive elements using the Tab key. The focus indicator is visible, and no keyboard traps were observed. This makes navigation easier for visitors who cannot or prefer not to use a mouse. [B6]

2. Clear Empty Search Feedback

When users search for a keyword with no matching results, the website displays the message "Maalesef bulamadık". This helps visitors understand that no matching content was found instead of leaving them with an unexplained blank page. [B2]

C2 – Three Ranked Recommendations

1. Add a Loading Indicator (High Priority)

- **Problem:** The website displays a blank white screen while loading under a Slow 3G connection.
- **Evidence:** [B1]
- **Who is affected:** Visitors with slow or unstable internet connections.
- **Recommended fix:** Add a loading animation or a short message to inform visitors that the page is loading.
- **Effort:** Medium

- **Impact:** High

2. Improve Form Labels (Medium Priority)

- **Problem:** Clicking on form labels does not move the cursor to the corresponding input fields.
- **Evidence:** [B5]
- **Who is affected:** Visitors filling out forms, especially users who rely on assistive technologies.
- **Recommended fix:** Properly connect each form label to its corresponding input field.
- **Effort:** Low
- **Impact:** Medium

3. Improve Form Error Messages (Lower Priority)

- **Problem:** Empty required fields are highlighted in red, but no clear explanatory error message is displayed.
- **Evidence:** [B4]
- **Who is affected:** Visitors who make mistakes while completing forms.
- **Recommended fix:** Display a clear message explaining which required field needs to be completed.
- **Effort:** Low
- **Impact:** Medium

Ranking Explanation: The loading issue is ranked first because it affects the initial experience of visitors using slow internet connections. The form label and error message issues are ranked second and third because they mainly affect visitors completing forms.
